# Linear Prediction

- A linear model is expressed in the form

$$\hat{y}_i = \sum_{j=1}^d x_{ij} \theta_j$$

The diagram illustrates the components of the linear model equation  $\hat{y}_i = \sum_{j=1}^d x_{ij} \theta_j$ . The summation index  $d$  is circled in purple, with a purple arrow pointing to it from the text "input dimension". The term  $x_{ij}$  is circled in orange, with an orange arrow pointing to it from the text "Input data, features". The term  $\theta_j$  is circled in blue, with a blue arrow pointing to it from the text "weights (i.e., model parameters)".

How do we  
obtain the  
model?

# How to Obtain the Model?

# How to Obtain the Model?

- **Loss function:** measures how good my estimation is (how good my model is) and tells the optimization method how to make it better.
- **Optimization:** changes the model in order to improve the loss function (i.e., to improve my estimation).
